

Problem

Multi Elevator and people calling all elevator at once just to use one when they are in hurry. Energy Waste.

Proposal

Use one control for all elevator (Group Controller) and use shortest part calculation to choose which elevator to go.

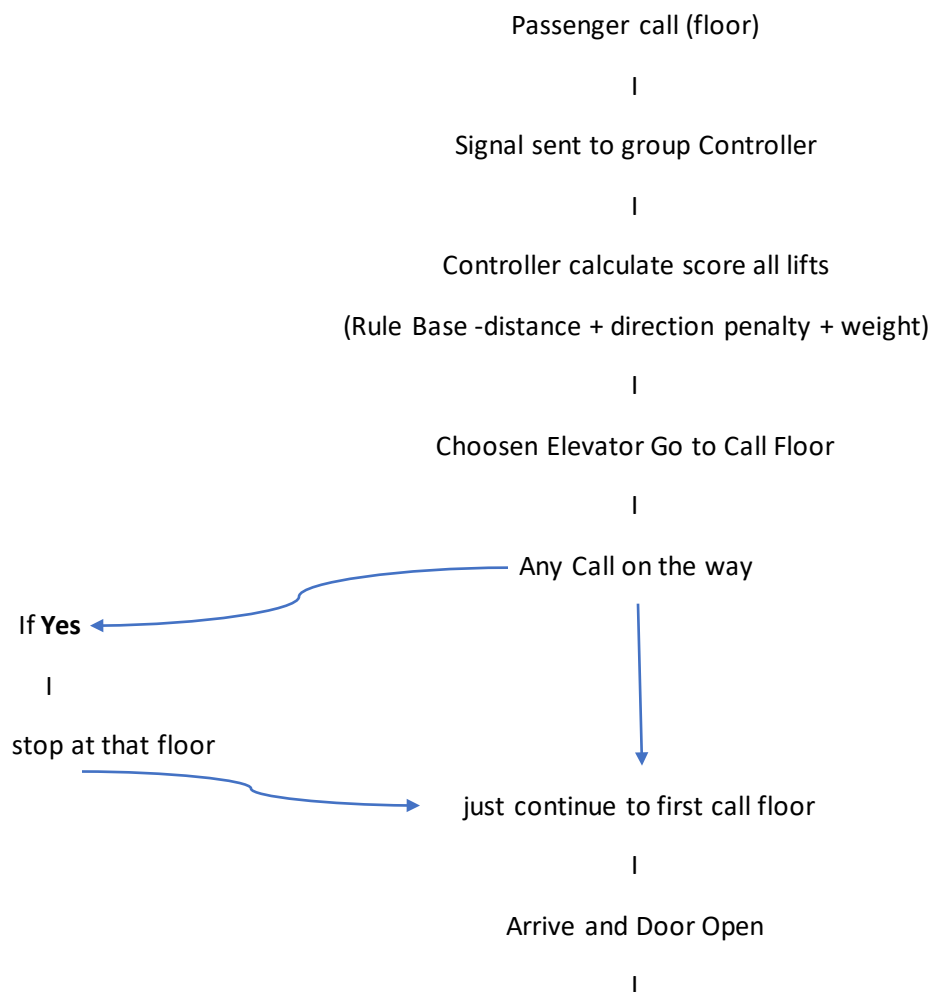

HCI

– if one call button is called, all buttons are linked on the same floor and all button will light up. So they won't think each elevator has separate controller and act different.

Feedback floor on each elevator is currently in

_ software that support elevator running floor showing, control , hold button, emergency, Chat (so everyone can connect through software to control room when it come to emergency and also every body who use that software aware emergency situation.
