

Elevator problems

problem: * long wait time during rush hour *

proposed solution:

assume: 30 floor building - a company

instead of all elevators going through all 30 floors, separate elevators to specific range.

for eg:

Elevator A:	6 - 10	] the ranges should be based off the facilities on each floor.
Elevator B:	11 - 20	
Elevator C:	21 - 30	

HCI pov: Elevator button redesign

most elevator have only open and close buttons

the problem: when someone wants to hold the elevator, in a rush, people usually press the wrong button

proposed solution: add a 'hold' button

when pressed, there should be voice feedback

for eg: "This elevator is on hold."

Press the hold button again to close the elevator"
